

- The following are the tools I used for this project:
 - React.js (create-react-app)
 - Redux (toolkit) for state management
 - CSS for styling.
- JSON data was fetched using the `fetch ()` method and `createAsyncThunk` (Redux).
- For fetching data, I have hosted the JSON file at this URL:
<https://api.npoint.io/5db36f1f51bbf556c139> => you can also use a localhost URL.
- We will simply change the URL when the API is ready.
- Filtering and sorting functions can be found in the Service folder
